also called genetic modification or genetic manipulation, is the direct manipulation of an organism's genes using biotechnology. It is a set of technologies used to change the genetic makeup of cells, including the transfer of genes within and across species boundaries to produce improved or novel organisms. - [Instructor] The idea of genetic engineering is something that we associate with the 20th century. We didn't even know that genes were actually the mechanism of heredity until the middle of the 20th century. And the direct modification of genes for some purpose really didn't even start happening until the 1970s.
